Open-pit mining is used for the mining of coal, iron ore, limestone, gold, dolomite, copper, petroleum, diamonds, marble, rock salt, and many other resources such as petroleum, salt, and gypsum. It can be a much more efficient and cost-effective method of mining when compared to underground mining. The main advantage of open-pit mining is that it requires less equipment and manpower, and it can be easier to organize and control. Additionally, the waste produced by open-pit mining, such as slurry and tailings, can be re-used as fertilizer, which can aid in plant growth. Open-pit mining is often used in conjunction with or in conjunction with underground mining. History Early mining Open-pit mining is an ancient practice. The gold, gemstones, and mineral industry have been operating for centuries in areas of the world where the sources are accessible. It is estimated that between 30 and 40% of the gold extracted annually since the beginning of recorded history was extracted using open-pit mining.

Goble's open-pit gold mine, located in the province of San Luis Potosí in Mexico, is still used today as an example of a

successful open-pit mining operation. It was originally built by Francisco Fernando Gomez between 1531 and 1536 and was reopened in 1554, and was visited by Hernán Cortés and Pánfilo de Narváez on their exploration of the area. At its peak, it employed thousands of people. By 1559, its operation had nearly depleted the resources of the mines, and the new owners needed to develop more modern and advanced mining techniques. This led to the creation of the first company for mining using the open-pit technique. By the 16th century, the open-pit mining technique was used in mining other minerals, such as iron ore.

This first use of open-pit mining for mining iron ore was invented by Spanish miners in the Pyrenees Mountains. Modern mining Roughly 100 years after the first large scale mining operation began to operate, the mining industry experienced its first major expansion. In the 17th century, the mining industry was struggling to keep up with a rapid population increase. This was due to the worldwide demand for iron ore, the rise of the mining industry, and the discovery of large deposits of coal. This caused a boom in mining activities. 82157476af
